

Challenge 1: Edit the layout of your app to your own liking.

Hint 1: You will have to modify the properties of components in the component list.

Hint 2: Try adding `HorizontalLayout` and `VerticalLayout` components

Challenge 2: When the user shakes the phone, clear the input textbox.

Hint 1: You will need a new component that detects acceleration changes.

Hint 2: To clear a text box, set its text property to an empty string.

Challenge 3: Add a slider that, when its value is changed, sets the pitch of the `textToSpeech` component

Hint 1: You will need a slider component. Use one of its events.

Hint 2: Use the setter of the pitch property in the `textToSpeech` component. And the getter from the `slider.position` property.
